The specialty of our own brains is that we have a system, which can give us real time information; it is that we form and destroy connections in our synapse to integrate and efficiently react with the environment around us.

In the same way, when differing areas of an organization come together each bringing with them specific methods of dealing with tasks and information, we need to draw connections so that they can effectively communicate. In the past this has been filled by using static applications.

Static applications which have been created for specific tasks. When change happens in the business or in the communications between the business areas, the application would need to go through a redesign if it has been statically created.

BRITE is an organization of people who passionately crafted a best in class core which is able to be built directly by the professional process and business owners. We have been able to form a core which, like the synapse of our own brains is able to quickly change according to the task or environment encountered, without the need to go through a painful development/test/develop/ test/ production process. It doesn't affect the other systems around it.

IT'S YOUR DESIGN WITH OUR TECHNOLOGY

Together we succeed.

Individual dedication to a group effort. None of us is as smart as all of us.

Always try harder.

We work hard every day to ensure that we exceed expectations.

It is the track, trace and translator between business divisions.

Business are comprised of very many neural pathways, these have been developed over time and through great pain and experience. Static applications have been developed to deal with the specific tasks in great complexity. Sharing and collaboration systems have been developed to deal with knowledge sharing and the generation of creativity.

However, there are certain times when various applications and departments need to work together, going after a single goal to achieve an end goal defined by another business head or department. This often happens during mergers and acquisitions, eDiscovery, audit, business reorganization and compliance actions. In these specific areas, each business is different. Each business has grown accustomed to its own methods of fetching and sharing information. It is in these situations that a CORE is needed, where processes can be quickly built, tested live and

integrated. A CORE, that during the process, can be altered and molded to the specific requirements of the action.

No other application is able to quickly build a data core, real time reporting, and GPS style process guidance for these changes to be tracked, managed and audited and for various business areas to be in one mind in executing the goal.

**With BRITE you
transform from knowing
what you do, to doing
what you know!**

We seek excellence.

We put “attention to details” above all else, and we do not take shortcuts.

Most businesses have come so far in creating processes to deal with all areas of the business. The problem is that these processes, once implemented, are static and require immense development and resource effort to change. This inhibits their ability to quickly test and implement their innovative ideas, rapidly adjust course or even deviate for a specific obstacles.

BRITE brings this rapid innovation, out of the technical engineering and development department, directly to your business desk. Thus enabling you to produce and test complex process innovations, bring data from outside sources and form your innovation in real-time.

Imagine the ability to then walk into the business and play these ideas directly in production. If a change is needed, BRITE gives you the possibility to change on the fly, tuning the engine directly at source and while running, giving you the output you envisioned and desired.

Need to adjust priorities? No problem. With our modular frame simply drag the priorities up the list of tasks/actions, to get a real-time view on how other tasks / actions will be affected. Analyze the what ifs, and make the go/no go decision. Everyone involved in the effected chain of events is notified and the current daily/weekly actions lists are instantly reordered.

Our core principles, serve as the foundation of behaviours, that drive us to constantly challenge where we are heading, generating work we are proud of.

AuditCaseMAN

AuditCaseMAN is designed to help companies manage a wide range of audit-related activities, data, and processes in a single, comprehensive framework. The audit management software provides the flexibility to support all types of audits, including internal audits, operational audits, IT audits, supplier audits, and quality audits.
